

Take-Home Assignment — Junior Full-Stack Developer (AI-Native)

Background

At HireMe, we work with AI tools (Cursor, Claude Code, and others) every day as an integral part of our development process. This assignment is meant to show us how you approach a real problem, build something that works end-to-end, and use AI wisely — exactly how you'd work with us.

This is not a big task. Please don't treat it as a huge project — we're looking for something simple that works, not a polished product.

The Task

Build a tool that takes a **GitHub username (or profile link)** and does the following:

- . **Fetches all public repositories** for that user.
- . **Reads the README** of each project.
- . **Sends the content to an AI** (any tool / API you choose) and gets back an **assessment of the project's level** — for example: how complex it is, whether the README is clear, what level of experience it reflects, etc.
- . **Displays the results** in a readable way — a short summary per project.

Example output (for illustration only — the format is your call)

Repo: todo-app

Level: Basic

Assessment: Simple CRUD app. Clear README with setup instructions.

Reflects solid understanding of basic React.

Requirements

- **Basic level is fine.** We're not looking for complex architecture — we're looking for clean code that works.
- **You may use any AI tool** you like (Cursor, Claude Code, ChatGPT, Gemini — whatever you're comfortable with). This is even encouraged.
- **Any language / stack / output format you choose** — CLI, web app, script. You decide what makes the most sense, and that decision is part of what we're evaluating.
- The tool should **run on our side** with clear instructions.

Technical tips

- GitHub has a public API for fetching repos and READMEs (no token required for public users, though a token raises your rate limit).
 - To read a README via the API you can use the file-content endpoint, or simply pull the raw file from the repo.
 - For each AI call — keep a clear, focused prompt that returns a concise assessment.
-

What We're Evaluating

- **Smart use of AI** — not just "running it," but knowing when and how. We'd love to hear how you used it.
 - **Working end-to-end code** — that it runs, handles basic errors (nonexistent profile, repo with no README), and doesn't crash.
 - **Decision-making** — why you chose the format / stack / approach you did.
 - **Clarity** — your own README with run instructions, and readable code.
-

Submission

- **Time:** Up to one week from receiving the task. Again — not because it's big, but to give you comfortable breathing room. If it takes you two days, great.
- Send us a **link to a GitHub repo** with the code and README.

- Feel free to add a few lines on how you approached it, which AI tools you used, and what the main challenge was.

Good luck — we're excited to see what you build!
